

PREVENTION AT SEA

Solutions for making life easier, and prevention a habit

26 June 2026 | Larnaca, Cyprus

Prevention at Sea awarded innovation grant for its MORSE platform under the RIF's EU BOOST Programme

Larnaca, Cyprus. Prevention at Sea (PAS) has been awarded an innovation grant for its MORSE platform under the EU BOOST Programme of the Research and Innovation Foundation (RIF), Cyprus's national body for research and innovation. The milestone shows the company's commitment to staying at the forefront of maritime innovation.

BOOST supports certified innovative companies in Cyprus as they develop and scale new technologies. For PAS, the grant will bring new development and new capabilities to MORSE, for the ship managers who rely on it every day.

MORSE is the PAS compliance and due diligence platform. It was built on a simple belief: compliance should be a source of operational insight, not a paperwork burden. Instead of data sitting in separate systems, MORSE connects logbooks, rest hours, vetting, insights, SMS and ERP in one environment. Ship managers get a single, reliable view of how their fleet is performing and where attention is needed, before an issue becomes a finding.

With the BOOST grant, PAS will develop new capabilities for MORSE, giving ship managers even more ways to turn compliance data into confident decisions.

"We are delighted to have been awarded an innovation grant for MORSE under the RIF's EU BOOST Programme. It will bring new development and capabilities to the platform our clients rely on to operate safely, compliantly and efficiently. We sincerely thank the Research and Innovation Foundation and its dedicated team for their invaluable support throughout the process. We are excited for what lies ahead."
